Update my existing FlashDrop Android application built with Kotlin and Jetpack Compose. Enhance the existing Printing Press category by adding a complete document and photo printing ordering system. Inspect the existing project first and integrate these features into the current app without breaking existing functionality.

1. Printing Press Customer Screen

When a customer opens the Printing Press category and selects the document printing option, display a dedicated **"Upload Documents for Printing"** screen.

Allow customers to upload one or multiple files in these formats:

- PDF (.pdf)
- JPEG (.jpeg)
- JPG (.jpg)
- PNG (.png)

Use Android's system file picker so customers can select files from their phone storage. Allow customers to add more files, preview supported files where possible, and remove files before placing an order.

Display each selected file's name, format, and upload status. Validate file types and file sizes, and show clear error messages for unsupported, corrupted, or unreadable files.

2. Print Quantity — Count Physical Prints, Not Just Files or Pages

The customer must select the number of physical prints they want, not simply the number of uploaded files or PDF pages.

Examples:

- A 10-page PDF with 1 copy = 10 physical printed pages.
- A 10-page PDF with 3 copies = 30 physical printed pages.
- A single JPG image with 5 copies = 5 physical prints.
- If a customer selects pages 2–5 of a 10-page PDF and requests 3 copies, count 4 × 3 = 12 physical prints.

For PDFs, allow customers to choose the page range and number of copies. For images, allow them to choose the number of prints per image. If multiple files are selected, clearly show each file's settings and the combined total number of physical prints.

Show the total number of physical prints prominently before checkout. Validate page ranges, copy counts, and quantity totals.

3. Printing Price Rules

Implement these exact default pricing rules for Black & White A4 printing:

- **1–1,000 physical prints:** ₹1.00 per print.
- **1,001 physical prints and above:** ₹0.70 per print for the entire order.

Do not use slab-wise pricing. When the order exceeds 1,000 physical prints, apply ₹0.70 to every physical print in that order.

Examples:

- 100 prints = ₹100.00
- 500 prints = ₹500.00
- 999 prints = ₹999.00
- 1,000 prints = ₹1,000.00
- 1,001 prints = ₹700.70
- 1,500 prints = ₹1,050.00
- 2,000 prints = ₹1,400.00

Automatically recalculate the printing subtotal whenever the selected files, PDF page ranges, or copy quantities change. Use accurate decimal or integer-paise calculations and format all amounts in Indian Rupees.

The applicable printing rate must be clearly visible before the customer adds the job to the cart.

4. Printing Price Table

Display this table clearly on the Printing Press screen, preferably below the upload section. Highlight the tier that applies to the customer's current total physical print quantity.

Total Physical Prints	Default Price Per Print	Printing Cost
1–100	₹1.00	Quantity × rate
101–500	₹1.00	Quantity × rate
501–1,000	₹1.00	Quantity × rate
1,001–2,000	₹0.70	Quantity × rate
2,001–5,000	₹0.70	Quantity × rate
Above 5,000	Use configured rate	As configured by Admin

The default rate must remain ₹1.00 for 1–1,000 prints and ₹0.70 for 1,001 or more prints unless an authorised Admin explicitly changes the pricing configuration. Do not apply ₹0.50 or any other unconfigured rate automatically.

Make the price table responsive and readable on different Android screen sizes. Clearly explain that when the order reaches 1,001 prints, the ₹0.70 rate applies to the entire order.

5. Printing Options — Black & White Only, A4 Compulsory

The customer must be able to select:

- **Printing type: Black & White only.**
- **Paper size: A4 only; compulsory and not changeable by the customer.**
- Single-sided or double-sided printing.
- Number of copies.
- PDF page range, where applicable.

Completely remove the Colour Printing option from the customer UI, printing forms, cart, and checkout. Do not display a colour-printing selector or allow customers to submit colour-printing jobs.

Keep A4 as the only available paper size in this initial implementation. Do not offer other paper sizes unless an authorised Admin later enables and configures them.

The ₹1.00/₹0.70 default rates apply only to Black & White A4 printing. Do not silently apply these rates to any future print type or option that requires separate pricing. Keep any future additional rates configurable by authorised Admins.

For double-sided printing, count physical printed sheets separately from printed page impressions. Show both the number of document pages/impressions and the estimated physical sheets when applicable, so customers can understand what they are ordering. Apply the configured price basis consistently and display it clearly.

6. Add a Fixed ₹19 Platform Fee

Add a **fixed ₹19.00 Platform Fee** to every eligible Printing Press order.

Rules:

- Charge ₹19.00 once per Printing Press order, not per uploaded file, page, copy, or physical print.
- If a single Printing Press order contains multiple files, charge the platform fee only once.
- Recalculate the fee correctly when the customer edits the cart or changes quantities.
- Do not add the fee repeatedly when the checkout screen is reopened, an order is retried, or the app is restarted.
- Do not charge this Printing Press Platform Fee on unrelated FlashDrop categories.
- If the existing cart architecture creates separate independent orders for separate Printing Press shops, apply the fee once per actual Printing Press order, following the existing order structure. Do not charge the same order twice.
- Clearly label the fee as **“Platform Fee: ₹19.00”** in the cart and checkout.
- Make the fee visible before the customer confirms the order.

Calculate the final amount as:

Final Payable = Printing Subtotal + ₹19.00 Platform Fee + Applicable Delivery Charge − Applicable Discounts

Use the existing FlashDrop delivery, discount, and free-delivery rules without overriding them. Do not silently waive or duplicate delivery charges.

Example: If printing costs ₹100.00, the Platform Fee is ₹19.00, and the applicable delivery charge is ₹10.00, the total before discounts is ₹129.00.

7. Cart and Checkout Integration

Add the printing job to the existing FlashDrop cart as a Printing Press order.

Display:

- Uploaded file names.
- Selected PDF page ranges and copies.
- Black & White printing type.
- Compulsory A4 paper size.
- Single-sided or double-sided selection.
- Total document pages/impressions and physical print quantity.
- Applicable price per print.
- Printing subtotal.
- Platform Fee: ₹19.00.
- Existing applicable delivery charge.
- Applicable discounts.
- Final payable amount.

Ensure printing orders work with the existing checkout, payment, order history, and delivery tracking system. Prevent duplicate cart entries, duplicate fees, and duplicate orders caused by repeated button taps or payment retries.

The backend must recalculate and validate the physical print quantity, configured rate, platform fee, discounts, delivery charge, and final payable amount. Do not trust prices or totals sent only by the Android client.

8. Shopkeeper and Admin Integration

Allow authorised Printing Press shopkeepers to receive printing orders and access the uploaded files required to fulfil them.

Show shopkeepers:

- Order ID and order status.
- Customer's printing instructions.
- File names and supported file formats.
- Secure file download/open action.
- Selected page ranges and copies.
- Black & White printing type and A4 paper size.

- Single-sided or double-sided selection.
- Total physical prints.
- Applicable printing rate and printing subtotal.
- Platform Fee and delivery details, where appropriate.

Restrict shopkeepers to their own authorised Printing Press orders. Preserve existing Admin permissions. Only authorised Admins may configure printing prices or enable additional printing options.

If Firebase is already configured, use Firebase Storage for document files and Firestore for printing order details. Apply secure Firebase Storage and Firestore rules so only the customer who owns the order, the authorised shopkeeper fulfilling that order, and authorised Admins can access the relevant files and order data. Do not make uploaded customer documents publicly accessible.

Use authenticated access and secure download links or equivalent Firebase-authorised access. Avoid storing sensitive file contents in publicly readable Firestore fields.

If the existing backend does not support secure file uploads, identify the missing configuration and explain the required setup rather than pretending the feature is fully connected.

9. UI Design and Implementation

- Maintain FlashDrop's existing logo and green-and-orange theme.
- Use clean, professional Jetpack Compose layouts.
- Support different screen sizes and Android devices.
- Show loading, upload progress, success, empty, and error states.
- Preserve existing Printing Press vendor listings and unrelated categories.
- Implement actual file selection, page-range handling, quantity calculation, secure storage, and order creation rather than creating only a visual mock-up.
- Remove all Colour Printing choices from the relevant UI and order flow.
- Keep A4 compulsory.
- Display the ₹19.00 Platform Fee transparently before checkout.
- Review all affected code and resolve compilation errors.
- Reuse the existing architecture, authentication, cart, and backend wherever practical instead of rebuilding unrelated features.

10. Validation and Testing

Test the following before considering the feature complete:

- 999 physical prints: printing subtotal ₹999.00.
- 1,000 physical prints: printing subtotal ₹1,000.00.
- 1,001 physical prints: printing subtotal ₹700.70.
- 1,500 physical prints: printing subtotal ₹1,050.00.
- A 10-page PDF with 3 copies: 30 physical printed pages.
- A selected PDF page range with multiple copies: correct physical print count.

- Multiple PDFs and images in one order: correct combined quantity and a single ₹19.00 Platform Fee.
- Image copies: correct print quantity.
- Single-sided and double-sided selections: correct and clearly explained quantity/sheet calculations.
- Colour Printing is not available.
- A4 is compulsory.
- Platform Fee is not duplicated on cart refresh, checkout reopen, payment retry, or app restart.
- Delivery and discount rules continue to work correctly.
- Unauthorised users cannot access uploaded documents or other shops' orders.
- Invalid, corrupted, oversized, or unsupported files show useful error messages.
- File upload failures can be retried safely.
- Order creation does not create duplicates.

Finally, inspect the project, implement the feature in the existing codebase, resolve compilation errors, run available tests, and report which parts were successfully implemented and tested. List any Firebase configuration or security-rule changes I must complete manually. Do not claim that a feature or test succeeded unless it was actually implemented and verified.
