Update my existing FlashDrop Android application built with Kotlin and Jetpack Compose. Add a fully functional **Drag & Drop file upload feature** specifically for the customer flow: **Printing Press category → Hemu Printing Press shop → Document Printing screen**.

Inspect the existing project first and integrate the feature into the current app without breaking existing functionality, other Printing Press shops, cart, checkout, or order management.

1. Where the Feature Must Appear

When a customer:

1. Opens the **Printing Press** category.

2. Selects the **Hemu Printing Press** shop.

3. Opens the document printing or upload screen.

Display a clear, large **“Drag & Drop Your Files Here”** upload area.

Do not add this feature to unrelated categories or shops unless the existing architecture already uses a shared printing upload component that can be configured for this specific shop.

2. Drag & Drop Upload Area

Create a professional upload area using Jetpack Compose with:

- A dashed-border drop zone.

- A document upload icon.

- The heading **“Drag & Drop Your Files Here”**.

- Supporting text: **“Drop your files here or tap to browse.”**

- A button labelled **“Choose Files”**.

- A visible highlight when a supported file is dragged over the drop zone.

- Success and error feedback after dropping or selecting files.

Support these file types:

- PDF (.pdf)

- JPG (.jpg)

- JPEG (.jpeg)

- PNG (.png)

Use Android-compatible drag-and-drop APIs, such as Compose drag-and-drop support or Android `View` drag listeners where appropriate. Handle files received from compatible sources such as supported file managers and other apps. Do not assume every Android device supports dragging files from every app.

3. Mobile-Friendly File Selection

Because many customers use phones, make the upload area work even when drag-and-drop is unavailable.

When the customer taps the drop zone or **Choose Files**, open Android's system document picker using an appropriate Activity Result API, such as `OpenMultipleDocuments` or `GetMultipleContents`.

Allow customers to:

- Select one or multiple files.

- Add more files after the initial selection.

- View selected file names and formats.

- Remove individual files before ordering.

- Preview supported PDFs or images where practical.

- See upload progress and clear errors.

Avoid duplicate file entries when the same file is added more than once. Validate MIME types and file contents rather than trusting filenames alone. Set reasonable file-size limits and display a clear message if a file is too large or unreadable.

4. Printing Configuration

After files are selected, display the settings for each file.

- PDF: allow the customer to choose a valid page range and number of copies.
- JPG/JPEG/PNG: allow the customer to select the number of prints per image.
- Paper size: **A4 only and compulsory**.
- Printing type: **Black & White only**.
- Allow single-sided or double-sided printing if supported by the existing printing workflow.
- Calculate and display the total physical print quantity across all selected files.

Do not show or enable colour printing.

5. Printing Prices and Platform Fee

Preserve these existing Printing Press pricing rules:

- 1–1,000 physical prints: ₹1.00 per print.
- 1,001 or more physical prints: ₹0.70 per print for the entire order.
- Add a fixed **₹19.00 Platform Fee once per eligible Printing Press order**.

Examples:

- 100 physical prints: ₹100 printing subtotal.
- 1,000 physical prints: ₹1,000 printing subtotal.

- 1,001 physical prints: ₹700.70 printing subtotal.

Calculate the final amount using:

Final Payable = Printing Subtotal + ₹19 Platform Fee + Applicable Delivery Charge − Applicable Discounts

Use the existing FlashDrop delivery, discount, and checkout rules. Do not duplicate the platform fee or delivery charge.

6. Upload and Secure Storage

If Firebase is already configured:

- Upload the selected files to Firebase Storage using authenticated access.
- Save file metadata, printing instructions, and order details in Firestore.
- Show upload progress and allow safe retries after failures.
- Do not expose uploaded documents through public download access.
- Restrict file access to the customer who owns the order, the authorised shopkeeper fulfilling it, and authorised Admins.
- Ensure the Hemu Printing Press shopkeeper can access files only for orders assigned to that shop.

If the project lacks the required Firebase configuration or secure upload implementation, identify the missing setup and explain it instead of simulating a successful upload.

7. Cart and Order Integration

After the customer confirms the files and printing settings, add the printing job to the existing FlashDrop cart.

Show:

- Shop name: Hemu Printing Press.

- Uploaded filenames.

- Page ranges and copies.

- Black & White and A4 settings.

- Total physical prints.

- Printing subtotal.

- ₹19 Platform Fee.

- Applicable delivery charge.

- Discounts and final payable amount.

Ensure the files and settings remain attached to the correct cart item and order. Prevent duplicate orders when the customer taps the submit button repeatedly or retries after a network failure.

8. Design and Implementation Requirements

- Maintain the existing FlashDrop logo and green-and-orange theme.

- Use responsive Jetpack Compose layouts.

- Make the drop zone large enough for comfortable touch interaction.

- Show clear visual states: idle, dragging over, uploading, uploaded, and error.

- Preserve existing shop listings, authentication, cart, checkout, and unrelated categories.

- Implement real drag-and-drop handling, system file selection, file validation, and backend integration—not just a visual mock-up.

- Inspect the existing code and resolve compilation errors.

9. Testing

Test:

- Dragging supported files from compatible Android sources.

- Tapping Choose Files on phones without drag-and-drop support.

- Selecting multiple files and adding more later.

- Removing a file before ordering.

- Unsupported, oversized, corrupted, and unreadable files.

- Correct page-range and copy calculations.

- Correct pricing at 999, 1,000, and 1,001 physical prints.

- One ₹19 Platform Fee per Printing Press order.

- Secure file access for the customer and authorised Hemu Printing Press shopkeeper.

- Correct cart and checkout integration.

Finally, report which features were actually implemented and tested, any compilation issues, and any Firebase configuration or security-rule changes I must complete manually.
