FlashDrop – Google AI Studio Prompt

Remove the unwanted UI boxes highlighted in red

Copy and paste this prompt into Google AI Studio

Update my existing FlashDrop Android app UI. Carefully inspect the screenshots I provided and remove ONLY the UI elements contained inside the red outlines. The red outlines are markup from my screenshots and must never appear in the app.

Apply these changes wherever the matching elements appear:

1. Order Tracking screen:
- Remove the green “Call” button/card highlighted in red if it is causing the layout to look broken or its text is displayed vertically.
- Do not let the rider information card overflow or become unusually narrow. If a call action is still needed, show it as a small, properly sized phone icon button with accessible content description, or omit it if it is part of the highlighted unwanted box.

2. Order Success / Order Confirmation screen:
- Remove the narrow orange “To Pay on Delivery” box highlighted in red.
- Keep “Payment Method: Cash on Delivery (COD)” displayed as one normal, readable horizontal row. Allow text to wrap naturally only when needed; never squeeze words vertically.

3. Checkout screen:
- Remove the orange information/banner box that says “Standard distance-based delivery charges apply to all orders (No Free Delivery mode active)” wherever it appears inside the red outline.
- Remove the “Platform & Safety Fee” row highlighted in red, including its label and ₹5 amount.
- Recalculate the payable total correctly after removing this fee. Do not keep the removed fee included in the total.

4. Cart screen:
- Remove the same orange delivery-mode information/banner box highlighted in red.
- Remove the “Platform & Safety Fee” row highlighted in red.
- Update the cart total and the “Proceed to Checkout” amount so they match the revised bill.

Important requirements:
- Remove only the highlighted unwanted boxes/rows. Do not remove product cards, product quantities, item subtotal, product discount, delivery charge, total payable, payment method, order ID, expected delivery, rider details, tracking timeline, or other useful UI.
- Keep the existing FlashDrop branding, logo, green-and-orange color theme, typography, navigation, and overall design.
- Keep delivery charges working according to the existing admin-controlled distance-based delivery rules and free-delivery settings. Removing the informational banner must not disable the delivery-charge calculation.

- Make all screens responsive on real Android phones of different sizes. Use proper Jetpack Compose layout practices such as Row, Column, weight, wrapContentHeight, and sensible width constraints. Avoid fixed narrow widths, text clipping, overlapping, and vertical letter wrapping.
- Ensure totals are calculated from the actual bill components. If the Platform & Safety Fee is removed from the UI and billing, remove it from the calculation logic too; do not merely hide the row.
- Preserve existing navigation, cart data, checkout flow, order placement, and tracking functionality.
- Do not rebuild unrelated screens or change the app's features beyond these requested UI and fee changes.
- Implement the actual code changes, not just a visual mockup. Review all affected screens and any shared bill/price calculation code, then fix compilation errors.

After making the changes, summarize which files/components were changed and confirm that the cart and checkout totals remain consistent.

Before you submit

Attach the screenshots with the red outlines to the same Google AI Studio conversation, then paste the prompt above. Review the generated changes and test the cart, checkout, order confirmation, and tracking screens on your phone.
