Update my existing FlashDrop Android application built with Kotlin, Jetpack Compose, and Firebase.

Feature: Show All Printing Press Shops Inside the “Printing Press” Category

1. Category Selection: When a customer taps the “Printing Press” category on the FlashDrop home screen or Categories page, open a dedicated Printing Press page.

2. Show All Printing Press Shops: Display all registered, Admin-approved, and active shops whose category is “Printing Press”. Fetch the shop information dynamically from the existing Firebase database. Do not display only a few sample shops or hardcoded shop names.

3. Shop Cards: Each shop card should display:

- Shop name
- Shop logo or profile photo
- Shop rating and review count, if available
- Distance from the customer's location, if location permission is granted
- Open/Closed status, if configured
- A clickable card to open the shop's products and services.

4. Printing Services: Inside each shop, display the printing services and products added by that shopkeeper, such as photocopying, colour printing, black-and-white printing, (“banners, visiting cards, wedding cards, lamination, and binding. Shopkeepers must be able to manage their own listings.”):- Make this Optional if it is allowed by Admin

5. Search and Filters: Add a search bar so customers can search for printing press shops by shop name. Add optional filters for distance, rating, and availability.

6. Firebase Integration: Read shops dynamically from the existing Firebase database. Use the existing shop category, approval status, and active status fields. Ensure that shops are categorized consistently, even if category names have different capitalization or extra spaces.

7. Admin and Shopkeeper Permissions: Admins can approve, deactivate, or change a shop's category according to existing permissions. Shopkeepers can edit their own shop information but cannot change their approval status or access another shop's data.

8. Empty and Error States: If no approved printing press shops exist, show “No Printing Press shops available yet.” Add loading indicators and appropriate error messages.

9. UI Design: Follow the existing FlashDrop design, green and orange theme, rounded shop cards, responsive layouts, and existing navigation.

10. Important: Integrate this feature into the existing application. Inspect the current Firebase schema before changing anything. Preserve all existing categories, customer accounts, shopkeeper accounts, Admin permissions, products, orders, and checkout functionality.

Expected Result: When a customer taps “Printing Press”, all approved and active Printing Press shops registered on FlashDrop appear on that page automatically. When a new Printing Press shop is approved by an Admin, it should appear automatically without requiring an app update.
