I want to redesign the Add New Address form in my FlashDrop application according to the attached reference image.

IMPORTANT: Only modify the Add New Address form. Do not change the existing app theme, primary colours, secondary colours, fonts, navigation, home screen, dashboard, or any other screen.

1. Location Section on Home Screen

When a customer clicks the location/address section at the top of the home screen, open the address management screen.

Display:

- Current selected location.
- Add New Address button.
- List of previously saved addresses.
- Option to edit or delete saved addresses.
- Option to select an address as the default address.

2. Add New Address Form

Create a clean form with the following fields:

A. Name*

- Customer's name.
- Required field.

B. Address*

- Flat / House Number.
- Building / Block.
- Street / Area.
- Required field.

C. Landmark

- Optional field.
- Example: Near Post Office, School, Hospital.

D. Address Label*
Display selectable buttons:

- Home
- Work
- Friend/Parent's Home
- Other

Only one label can be selected at a time.

E. Mobile Number*

- Country code selector (default +91).
- Mobile number input.
- Validate Indian mobile numbers.

F. Default Address

- Checkbox or toggle: Set as default address.
- If selected, make this the customer's default delivery address.

3. Save Address Button

- Add a clearly visible Save Address button at the bottom.
- Validate all required fields.
- Show appropriate error messages.
- Save the address when the customer clicks the button.
- Display a success message after saving.

4. Address Management

- Allow customers to save multiple addresses.
- Allow editing existing addresses.
- Allow deleting addresses after confirmation.
- Allow switching between saved addresses.
- Only one address can be the default address.
- Automatically use the selected default address during checkout.

5. Data Persistence

All address information must be saved permanently using the application's existing data-storage system.

Requirements:

- Do not lose addresses when the app closes.
- Do not lose addresses when the customer logs out and logs in again.
- Keep customer addresses associated with their individual accounts.
- Sync addresses with the existing backend/database if available.
- For demo mode, use persistent local storage.

6. Design Requirements

Follow the attached reference image for the layout and structure of the address form.

However:

- Preserve FlashDrop's existing colour scheme.
- Preserve existing typography.
- Preserve existing button styling wherever possible.
- Make the form responsive for Android phones.
- Use proper spacing and rounded input fields.
- Ensure the Save Address button is accessible without layout problems.
- Support scrolling when the keyboard opens.

7. Important Restrictions

DO NOT:

- Change FlashDrop's orange, green, or any existing theme colours.
- Redesign the home screen.
- Change the bottom navigation bar.
- Change the existing category pages.
- Change customer, shopkeeper, or admin dashboards.
- Modify the login or registration system.
- Remove any existing functionality.

ONLY redesign and implement the Add New Address form and its related address-management functionality.

Before completing, test adding, editing, deleting, selecting, and saving multiple addresses.
